

PROFESSIONAL ENGAGEMENT SYSTEM

Professional Engagement System is designed for conducting an overall flow of engagement process. Starting from when an engagement is made, the system covers scheduling, assigning, monitoring, reviewing, filing, invoicing, and collection. It will capture all the important information of an engagement into the system, and an integrated document repository will store the important documents. The document repository helps to ease on retrieving and reducing of possible loss of deliverables or important documents in any circumstances. With this solution, you are able to track the progress status of the engagement as well as the collection status. Instead of the old reviewing process, the solution helps to reduce the operation cost (such as paper, printer cartridge, file, filing cabinets, etc).

Professional Engagement System is a web-based solution with more options on the implementation (locally or through internet). It is easier to maintain and apply. Mainly, the system requires a higher-end main computer/server, depending on the usage and implementation method. Other computers (clients) that connected to the main computer/server can be of normal specifications, as long as they are installed with a browser, such as Mozilla Firefox, Internet Explorer, etc.

This full cycle of engagement system is helping the company to:

- Improve the efficiency in operation and customer relationship.
- Monitor the progress of the engagement with one click.
- Reduce the operation cost.
- Review the process of the deliverables and ease the work to retrieve.
- Directly file the final copy of the deliverables.
- Issue invoice upon completion, stage by stage (milestone).
- Monitor the collection based on the invoice issued.
- Act as document repository, that centralise all the final deliverables or the important documents.
